

## Black Molly (Poecilia Sphenops)

**Distribution:** Mexico, Colombia

**Water temperature:** 26-28 degrees Celsius

**Max size:** 2.5-3.5 inches

**Ideal tank size:** 65 litres and above

A sleek and elegant looking fish that gives a nice contrast with a light colour substrate, a great addition to the tank.

One or two pairs can be kept in a suitable size aquarium, or more in a larger community setup.

They occupy the middle-upper levels of the tank and get on with most other robust community fish. Ideal setup would be a well planted tank without bogwood or other types of wood that alter the water chemistry.

They eat flake food and frozen/live foods, such as bloodworm/brineshrimp. They also appreciate live foods, but overall are not fussy eaters.
